TRANSPARENT TECHNICAL BETA

Jevify

Graphify code graphs with reviewed memory hints

Graphify remains the graph engine

COMPONENT BOUNDARY

Graph structure and reviewed context stay separate

Graphify graph › **Reviewed source paths** › **Jevify validation** › **Agent source check**

Memory is a hint. The graph is navigation evidence. The agent verifies the source.

LOCAL WORKFLOW

Five bounded steps with the original fallback

1

Confirm graph and repository commit match

2

Read selected, reviewed observations

3

Validate source paths in the repository

4

Run bounded Graphify traversal

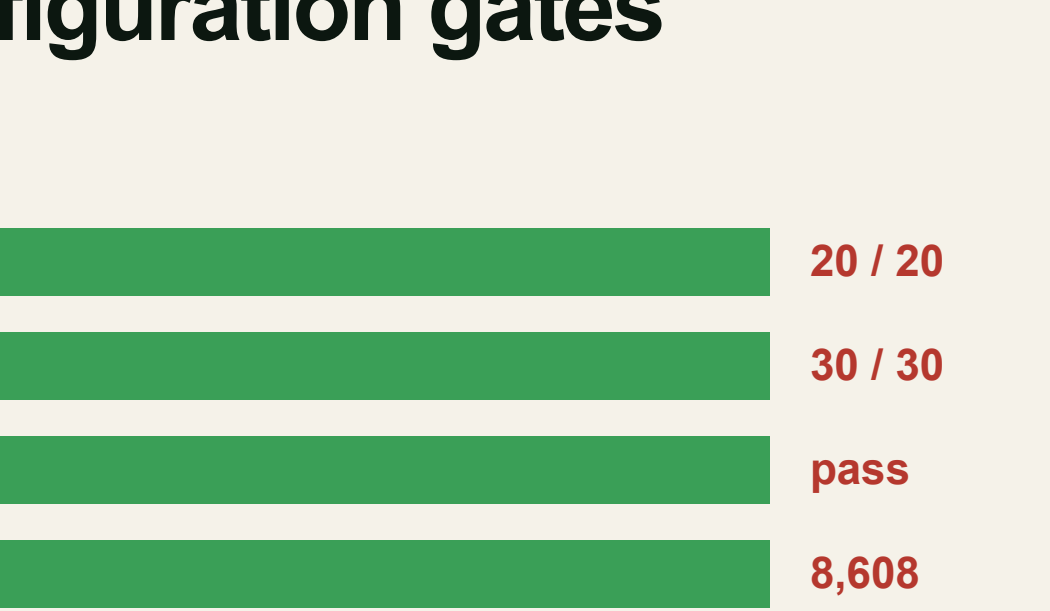

5

Fall back when evidence is absent or invalid

The default path runs offline. Paid JEV calls stay optional and require explicit approval.

BETA EVIDENCE · CANDIDATE A2F7AEE0

The installation and zero-configuration gates passed

Installation covered Ubuntu and macOS. Zero-configuration cases required no interaction.

Evidence hashes are published in the beta scorecard

STOPPED EVALUATION

The long product benchmark is closed for this beta

0 / 60

v13 stopped after the technical beta decision

Earlier v11 run

8 pairs

classification

diagnostic

public proof

No long benchmark or paid API run is part of the release decision.

EVIDENCE BOUNDARY

What the technical beta supports

Supported

- Clean installation on Ubuntu and macOS
- Zero-configuration execution without interaction
- Graphify-compatible fallback
- Offline default operation

Still open

- Real-user task outcomes
- Independent product evaluation
- Results across more repositories and question types
- Maintainer feedback on the interoperability boundary

REVIEW REQUEST

Three focused questions for maintainers

Graphify

Does the adapter preserve graph semantics and the original fallback?

Claude Mem

Is reviewed `source_paths` metadata a safe interoperability boundary?

JEV

Is the opt-in decision interface appropriate for a later independent evaluation?

Start with the beta scorecard, then inspect the offline demo and source contracts.
